Hort Americas Intros LED Grow Light

Jennifer Zurko

Hort Americas has introduced the Philips GreenPower LED Production Module, a light fixture that's been used successfully by commercial growers and horticultural researchers worldwide.

The Philips Horticultural LED Grow Light is available in an UL-approved 110-volt version in the United States. The waterproof Production Modules come in two lengths: 120 cm (about 4 ft.)

and 150 cm (about 5 ft.). The modules are available in Deep Red/Blue (general light good for a variety of growing applications) and Deep Red/White (if work light is needed). At between 35 to 43 watts, the modules can replace many T5 or T8 fluorescent grow light applications and greatly reduce energy consumption.

Production Modules are ideal for multi-layer production of leafy greens and herbs, and for the production of young plants and potted plants. Currently, the Production Modules are being tested on a variety of ornamental plants for day length extension and photoperiodic manipulation applications.
