## New TerraGrow Improves Soil

*Jennifer Zurko*

BioSafe Systems introduces its first new product of 2015—TerraGrow. This completely soluble powder of perfectly blended beneficial bacterial and fungal spores was developed to improve soil characteristics, plant stress tolerance and vigor. Use TerraGrow for a wide variety of crops, including ornamental/nursery, vegetables, fruits, herbs, turf/landscape and hydroponics.

TerraGrow's formulation has been scientifically selected, with more than 3 billion colony-forming units per gram for soil and plant attributes and formulation compatibility. As an added bonus, TerraGrow is packed with a nutrient-rich growth boost package to quickly germinate spores and promote rapid population growth.

"Adding beneficial microbial inoculants to our product line seemed natural," says BioSafe Systems' T&O Market Segment Manager Jeff Kline. "We specifically designed TerraGrow with naturally occurring microbial strains that have not been genetically altered. Each strain in TerraGrow occupies a slightly different niche within the plant's root zone, allowing each to provide specific benefits to the plant while avoiding competition with each other."

TerraGrow is easily incorporated into any crop protection program and can be used throughout the growing season to keep crops healthy. Also, TerraGrow is an important step to improve soil health in BioSafe's sustainable soil program.

For more information about TerraGrow, contact BioSafe Systems at (888) 273-3088 or visit [www.biosafesystems.com](http://www.biosafesystems.com). **GT**
